

Mapping & Prioritizing Markets for a Novel Technology

The Strategic Challenge

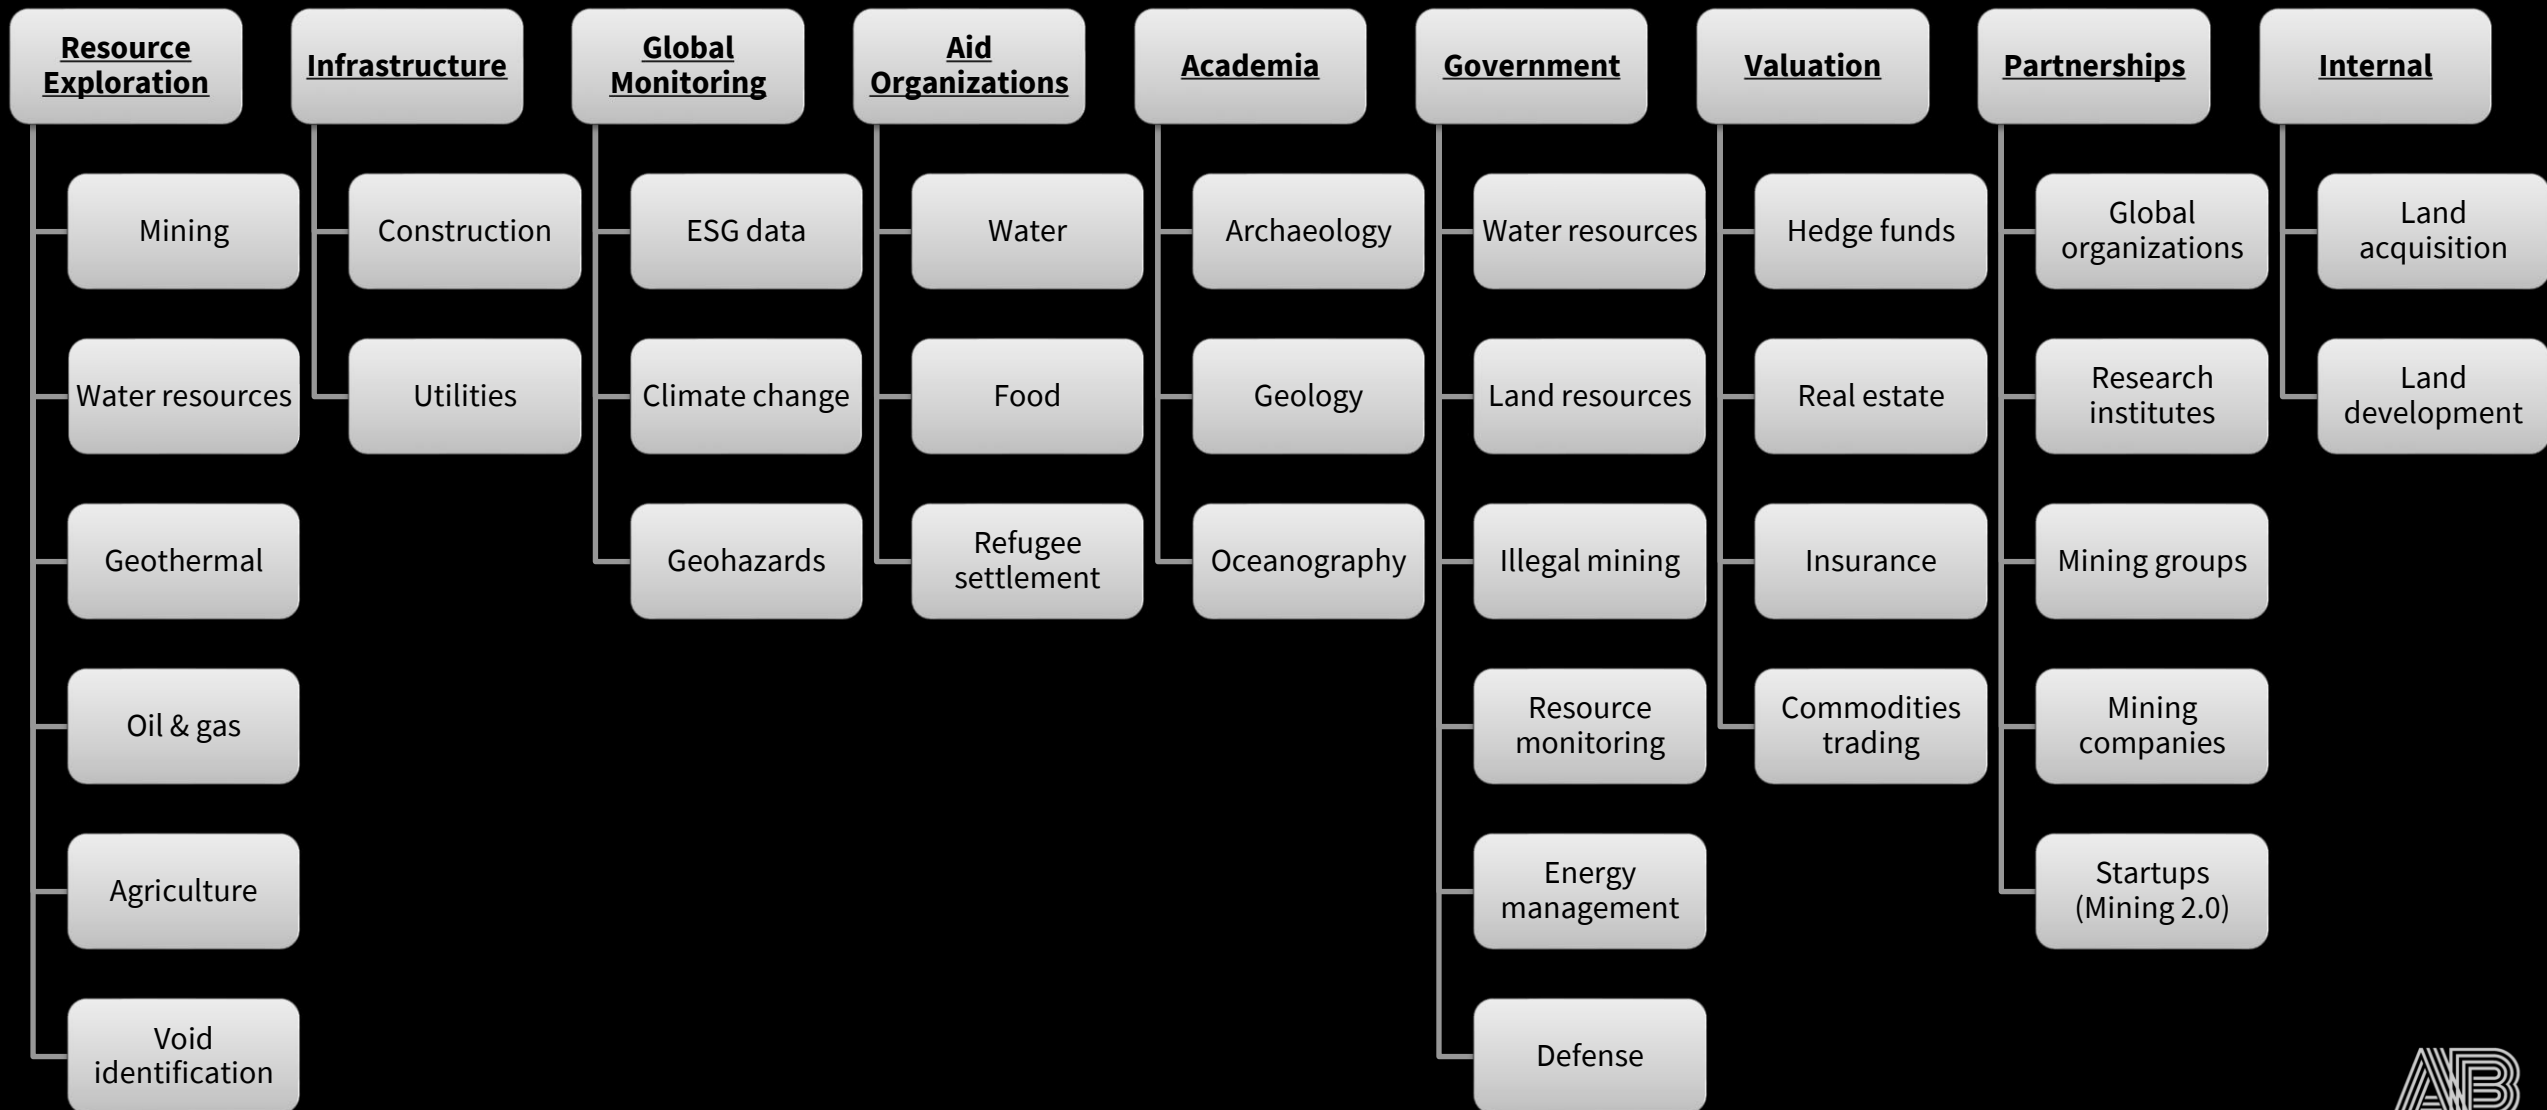

Our subsurface imaging technology can see over a mile underground, far beyond anything that currently exists. But with no established market, we need a clear entry point before committing commercial direction.

We mapped the full landscape of viable industry applications against two parallel sets of criteria:

1. Commercial factors: market size, willingness to pay, sales cycle, and urgency of need
2. Technical fit factors: depth, resolution, and data accuracy each industry requires relative to what our satellite can deliver at each stage of development

The goal is to identify the right first market and define a roadmap for expansion.

The Full Market Map

Market Landscape: Categorized and Prioritized

Geophysical Services

Initial Focus

Mining

Large market · High WTP · Long sales cycle · High urgency · v1 satellite

Water Resources

Large market · Medium WTP · Long sales cycle · Very high urgency · v1 satellite

Geothermal

Medium market (growing) · Medium WTP · Medium to long sales cycle · High urgency · v1 satellite

Oil & Gas

Very large market · Very high WTP · Very long sales cycle · High urgency · v2 satellite

Infrastructure

Large market · Medium WTP · Variable sales cycle · High urgency · v3 satellite

Data Intelligence

Longer-term Vision

Real Estate

Very large market · High WTP · Medium sales cycle · Medium urgency · Full constellation

Insurance

Very large market · High WTP · Medium to long sales cycle · High urgency · Full constellation

ESG Data

Growing market · Medium WTP · Variable sales cycle · Medium urgency · Full constellation

Other Markets

Evaluated, deprioritized

Global Monitoring (climate, geohazards)

Academia (archaeology, geology)

Government (resource monitoring)

Aid Organizations

Initial Focus: Geophysical Services

Geophysical Services is the initial focus given its combination of market size, commercial readiness, and alignment with current satellite capabilities.

Geophysical Services Vertical Assessment

				
Mining	Water resources	Geothermal	Infrastructure	Oil & gas
Approximately 1 in 100 exploration projects result in a mine. Our accuracy reduces unnecessary exploration costs as well as environmental damage while providing key information on resource concentration to make informed decisions on mine development.	Over 2 billion people currently live in countries experiencing high water stress. We can find new aquifers, track water changes over time, and identify underground voids for storing desalinated water.	Only 7% of the world's geothermal potential has been tapped so far. We can find new geothermal sources, map the underground systems that supply thermal energy, and track reservoir usage over time.	Infrastructure projects require an understanding of underground pipes, structures, and sink holes. Our precise maps save companies from unexpected costs and accidental damage during construction.	Seismic surveys, the most common method for offshore oil and gas exploration, cause widespread harm to marine life. Our remote exploration process will provide more accurate information while eliminating negative environmental consequences.

Beachhead Market: Mining

BEACHHEAD	INITIAL FOCUS		UP NEXT			VISION	
							
Mining	Water resources	Geothermal	Earth observation	Archaeology	Real estate	Moon	Asteroids
							
	Oil & gas	Infrastructure	Hedge funds	Insurance	ESG data	Mars	

The Decision: Why Mining

High willingness to pay

Mining exploration is expensive and high-stakes. Only 1 in 100 exploration projects results in a mine. Better data directly reduces wasted cost and environmental damage.

Clear, urgent pain

Current methods are slow, invasive, and imprecise. Our technology could deliver better data in 3 minutes versus weeks in the field.

Strong technical fit

Mining depth and resolution requirements aligned with first-generation satellite capabilities.

The market prioritization will shape our product roadmap, satellite build and launch sequence, pricing model, and fundraising narrative. It also defines the longer-term data intelligence vision, where the same subsurface dataset could serve real estate, insurance, and ESG markets as the constellation scales.
